

Replication Materials, [Event Study Results](#), for

[WHY DO COUPLES AND SINGLES SAVE DURING RETIREMENT? HOUSEHOLD HETEROGENEITY AND ITS AGGREGATE IMPLICATIONS](#)

by Mariacristina De Nardi, Eric French, John Bailey Jones and Rory McGee

JPE MS 2021-11-29

February 2024

Overview: This file describes how to generate the event study results used in our paper. There are three sets of results.

1. **[Data Event Studies \(Figure 2\)](#).**
 - a. The replication materials for these results are housed in the subdirectory “eventstudy\Stata”.
 - b. We use a matched Difference-in-Differences Estimator. The Stata file “[getmatch_rm.do](#)” generates a matched control group for households who experience a death; we used Stata version 16 but have adapted the code to reproduce the results in later versions of Stata. The matched sample is saved in the output file “tmp3_rm_match_died_after_3_or_4_or_5_waves_tighter_assets_correct_topcoding_09042021.dta”.
 - c. The master program, “[event_study_master.do](#)”, produces our event study analysis figures. This is designed to be run with both original HRS data and simulated data (see point 2 below). To run a version that does **not** require simulated output, set the local macro **noSIM=1 (line 9)**.
 - d. The master program calls “deathwealth_rm4_couples5.do” which reformats the data and estimates the event study regressions – saving the point estimates and standard errors.
 - e. The estimates are then used by the master program to produce a series of figures which are stored in the subdirectory “/DiD/”. The working directory is set on line 11 of the program.
 - f. Figure 2 corresponds to “AssetsDiD_couples_DATA.pdf” and “OOPDiD_couples_DATA.pdf”.
2. **[Data + Model Simulation Event Studies \(Figures 9, A19, A20\)](#).**

[Preparing The Simulation Output](#)

 - a. In order to produce the validation figures the structural model must first be simulated. See readme_model and ResultsGuide_DFJM_JPE for more details.
 - b. After simulating the model, the user must run the additional GAUSS script “[exportsimwlthmat.gau](#)” which converts the GAUSS arrays in memory to a Stata-readable format. This script is contained in the subdirectory “eventstudy\GAUSS”. It produces the output file “wlthmatSIM.xls”.

- c. The Stata file (in “eventstudy\Stata”) “[clean_sim_panel.do](#)” produces a panel dataset for simulated households that is analogous to the HRS panel. This file needs to be run whenever `wlthmatSIM.xls` is changed.

[Producing Event Study Figures](#)

- d. Given the Stata formatted simulated panel, the master program, “[event_study_master.do](#)”, produces our event study analysis figures. This is designed to be run with both original HRS data and simulated data (see point 1 above). To run a version that uses simulated output, set the local macro `noSIM=0` ([line 9](#)).

This will call “SIMdeathwealth_rm4_couples5.do” which corresponds to point 1d above.

- e. Figure 9 corresponds to “AssetsDiD_couples.pdf”, “AssetsDiD_couples_above.pdf”, “AssetsDiD_couples_below.pdf” and “OOPDiD_couples.pdf”, “OOPDiD_couples_above.pdf”, “OOPDiD_couples_below.pdf”
- f. Figure A19 corresponds to “AssetsDiD_couples_lowPI.pdf”, “AssetsDiD_couples_midPI.pdf”, “AssetsDiD_couples_topPI.pdf” and “OOPDiD_couples_lowPI.pdf”, “OOPDiD_couples_midPI.pdf”, “OOPDiD_couples_topPI.pdf”
- g. Figure A20 corresponds to “AssetsDiD_couples_low_age.pdf”, “AssetsDiD_couples_mid_age.pdf”, “AssetsDiD_couples_top_age.pdf” and “OOPDiD_couples_low_age.pdf”, “OOPDiD_couples_mid_age.pdf”, “OOPDiD_couples_top_age.pdf”

3. [Data + Model Simulation Event Studies for Alternative Parameterisation \(Figure A13\)](#).

- a. To produce Figure A13 the structural model must first be simulated at alternative parameter values. See `readme_model` and `ResultsGuide_DFJM_JPE` for more details.
- b. After simulating the model at the appropriate parameter values please repeat the steps documented above in point 2a-e. This will allow you to produce figures at the alternative parameter values.
- c. Figure A13 is produced as “AssetsDiD_couples.pdf”

4. Please contact us if something is unclear, so that we can improve the documentation, and make it clearer for everyone.
